

Universal Autonomous AI Workforce Runtime

High-Performance Rust Architecture for End-to-End Remote Digital Employees

PAGE 01 / 42

The Paradigm Shift: From Scripted Bots to Autonomous Remote Employees

Fathom introduces a production-grade, self-hosted **Rust runtime** designed to instantiate, govern, and orchestrate true **autonomous remote digital employees**. These agents independently plan, execute multi-day workflows, operate web browsers via accessibility trees, perform deep OSINT/lead generation, write and maintain software, and interact across all corporate channels 100% remotely.

100% REMOTE OPERATION

Autonomous agents operate independently inside sandboxed environments, interacting with web portals, public registries, APIs, shells, and CRMs 24/7.

MICROSECOND RUST ENGINE

Zero-cost abstractions, Tokio async I/O, and concurrent JoinSet task trees provide sub-millisecond tool dispatch (~0.75 ms) and 94 μ s memory absorption.

UNLIMITED NEURAL COMPUTE

High-throughput routing to cost-efficient frontier foundation models (Kimi k3, Qwen 3.8 Max, GLM 5.3) enables flat-rate monthly seat economics.

Strategic Objective: Deliver a scalable software foundation where businesses deploy digital workers on demand—scaling operational capacity infinitely without proportional linear headcount expansion.
