

Automated Customer Onboarding & Support

Autonomous Technical Setup, API Verification & 24/7 Troubleshooting

PAGE 19 / 42

Scenario Brief: Accelerating B2B Client Time-to-Value

Company: DataStream API (Developer Infrastructure Platform).

Objective: Guide new enterprise customers through webhook configuration, test payload verification, and initial API key provisioning with zero support backlog.

AUTONOMOUS SUPPORT OPERATIONS

- **Incoming Ticket Triage:** Reads incoming support emails or Slack channel queries, identifying customer intent and technical requirements.
- **Code & Log Inspection:** Uses sandboxed REPL (`python_exec` / `node_exec`) to replicate customer webhook payloads and diagnose syntax errors.
- **Browser-Driven Setup:** Accesses internal admin portals via governed Playwright computer control to verify client account provisioning.
- **Contextual Resolution:** Queries persistent semantic memory for past resolutions, delivering precise, tested code fixes.

MEASURABLE PERFORMANCE GAINS

- **First Response Time:** Reduced from 45 minutes to **under 12 seconds**.
- **Onboarding Duration:** Enterprise onboarding cycle compressed from 5 days to **2 hours**.
- **Resolution Rate:** 78% of Tier-1 and Tier-2 developer onboarding tickets resolved without human engineer involvement.
- **Customer Satisfaction:** CSAT increased from 82% to 98% due to instant technical resolution.

HUMAN ESCALATION PROTOCOL

If a ticket involves critical billing changes or unfamiliar error edge cases, the coworker pauses, summarizes the diagnosed root cause, and hands off the session to a human senior engineer with full contextual notes and reproduction scripts.

Scale Without Support Headcount: Handle 10x customer growth while maintaining instant response times and flawless technical onboarding.
