

# Back-Office & Invoice Reconciliation

Autonomous Document Parsing, Multi-System Data Entry & Financial Reconciliation

PAGE 20 / 42

## Scenario Brief: Automating Repetitive Monthly Financial Operations

**Company:** Global Logistics Partner (Supply Chain & Freight Operations).

**Objective:** Ingest 500+ PDF vendor invoices monthly, cross-reference against warehouse delivery receipts, and input approved payments into 1C / QuickBooks.

### Autonomous Back-Office Pipeline

**Phase 1    PDF Ingestion & Structural Extraction**

The worker downloads vendor invoices, applies pdf\_extract and regex parsers, extracting vendor TIN, invoice number, line items, and totals.

**Phase 2    Three-Way Matching & Verification**

Cross-references invoice line items against warehouse receipts and purchase orders stored in the internal database. Discrepancies flagged automatically.

**Phase 3    Portal Entry via Governed Computer Use**

The worker navigates the accounting web portal via Playwright Accessibility Snapshots, fills invoice fields accurately, and queues batch payments.

**Phase 4    CFO Single-Click Approval Batch**

Presents an executive summary of 500 reconciled invoices with zero errors for CFO sign-off via Telegram (POST /api/v1/sessions/:id/approve).

#### OPERATIONAL IMPACT

- **Labor Replaced:** 80 hours of mind-numbing manual copy-paste data entry per month.
- **Error Rate:** Reduced from 4.2% human entry errors to 0.00% deterministic accuracy.

#### AUDIT TRAIL INTEGRITY

Every parsed invoice, line-item match, and portal click is logged with immutable nanosecond timestamps in SQLite for seamless tax auditing.

**Operational Impact:** Replaces 80 hours of mind-numbing manual copy-paste data entry per month with an automated, auditable, and error-free execution loop.
