

The Enterprise Entity Knowledge Graph

Mapping People, Companies, Roles and Technologies into an Interconnected Web

Relational Knowledge: Beyond Flat Text Records

Fathom does not merely store isolated snippets of text. In `crates/memory`, it structures verified information into a **typed, directional Entity Knowledge Graph** that captures the rich web of corporate and professional relationships.

TYPED GRAPH RELATIONSHIPS

- Person —[works_at]→ Company (with title & seniority)
- Person —[leads]→ Department (e.g. Engineering)
- Company —[invests_in]→ Startup (with funding round date)
- Company —[uses_tech]→ Technology (e.g. AWS, Next.js)
- Company —[competes_with]▶ Competitor (direct market rival)

6-HOP GRAPH TRAVERSAL QUERIES

Agents query the graph to answer complex relational questions:

- *"Which former Stripe engineers are now CTOs at Series-A AI companies in Berlin?"*
- *"Which competitors are backed by the same venture fund as our company?"*

Graph Visualization & Tool Integration (`memory_graph`)

SHARED SWARM INTELLIGENCE

When one researcher agent discovers a person's new company affiliation, every other agent across the organization gains immediate access to the updated graph node, creating a shared organizational brain.

Shared Swarm Intelligence: When one researcher agent discovers a person's new company affiliation, every other agent across the organization gains immediate access to the updated graph node.
