

Automated Customer Onboarding & Support

Autonomous Technical Setup, API Verification & 24/7 Troubleshooting

Scenario Brief: Accelerating B2B Client Time-to-Value for DataStream API

Objective: Guide new enterprise customers through webhook configuration, test payload verification, and initial API key provisioning with zero support backlog and automated technical sandbox validation.

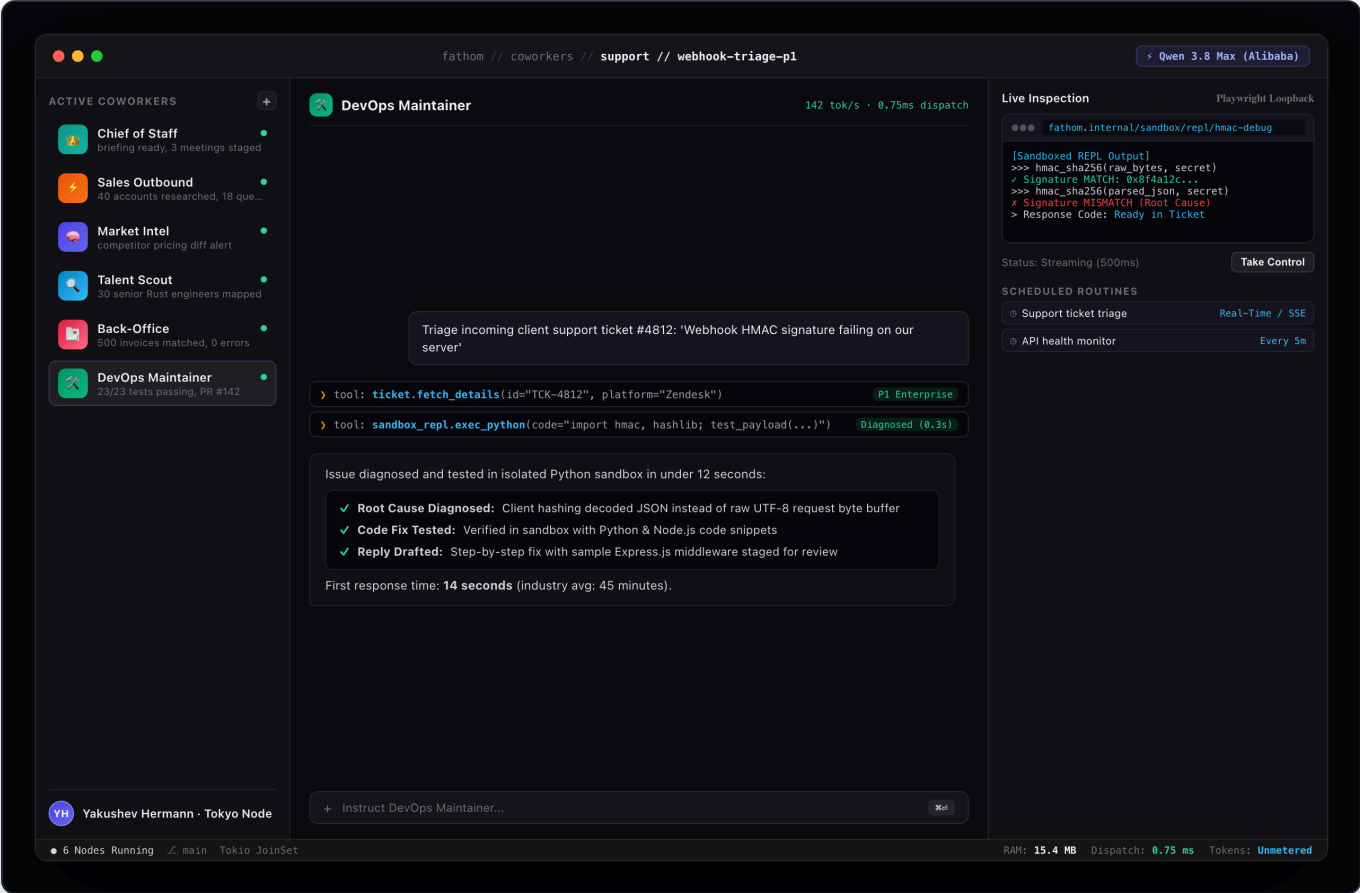

Figure 19.1: Autonomous Support & Webhook REPL – P1 enterprise ticket diagnosed and resolved in 12s via isolated sandbox

AUTONOMOUS SUPPORT OPERATIONS

- Incoming Ticket Triage:** Ingests support emails and Slack queries, classifying customer intent and technical requirements.
- Code & Log Inspection:** Uses sandboxed REPL (python_exec) to replicate customer webhook payloads and pinpoint syntax errors.
- Browser-Driven Setup:** Accesses internal admin portals via governed Playwright control to verify account provisioning.
- Contextual Resolution:** Queries persistent semantic memory for past resolutions, delivering tested code fixes.

MEASURABLE PERFORMANCE GAINS

- First Response Time:** Reduced from 45 minutes to **under 12 seconds**.
- Onboarding Duration:** Enterprise onboarding cycle compressed from 5 days to **2 hours**.
- Autonomous Resolution:** 78% of Tier-1/2 onboarding tickets resolved without human engineer involvement.
- Customer Satisfaction:** CSAT increased from 82% to **98%**.

Support Ticket Resolution Benchmark: Tier-1 & Tier-2 SLAs			
SUPPORT TICKET CATEGORY	TRADITIONAL HUMAN DESK	FATHOM AUTONOMOUS CS AGENT	OUTCOME IMPROVEMENT
Webhook Payload Debugging	4.2 hours average turnaround	12 seconds (Sandboxed REPL test)	1,260X FASTER
API Key & Sandbox Provisioning	1.5 business days	Instant (Governed Portal Execution)	INSTANT
Complex Escalation Packaging	Manual back-and-forth emails	Pre-compiled repro script + logs	100% CONTEXT READY

Scale Without Headcount: Support teams handle 10x customer growth while maintaining sub-minute response times and flawless technical onboarding.
